Canadian Technical Report of Hydrography and Ocean Sciences

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. The subject matter is related generally to programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

Rapport technique canadien sur l'hydrographie et les sciences océaniques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Le sujet est généralement lié aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports techniques peuvent être cités comme des publications complètes. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982 du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

ABSTRACT

Hendry, R.M. 1989. Hydrographic Measurements from C.S.S. Hudson Cruise 82-002. Can. Tech. Rep. Hydrog. Ocean Sci. No.118: iv+112 pp.

Hydrographic data collected on Cruise 82-002 of C.S.S. Hudson, April 11 to May 2, 1982, are described. Seventy-eight stations were occupied on a line running near 48°N from the mouth of the English Channel to the Grand Banks of Newfoundland. Pressure, temperature and salinity were measured by a Guildline digital CTP system. Salinity, dissolved oxygen, silicate, nitrate and phosphate were measured from water samples collected on the CTP upcasts. Figures showing the plan of stations, bottom topography and sectional views of the observed temperature, salinity, potential density, oxygen and nutrients are presented. CTP and discrete bottle data and associated derived parameters are tabulated at standard levels. The CTP data at 2-decibar intervals and digital bathymetric data are available in computer-compatible versions in formats described in appendices to the report.

RÉSUMÉ

Hendry, R.M. 1989. Hydrographic Measurements from C.S.S. Hudson Cruise 82-002. Can. Tech. Rep. Hydrog. Ocean Sci. No.118: iv+112 pp.

On présente les données hydrographiques recueillies lors de la campagne 82-002 du n.h. Hudson, entre le 11 avril et le 2 mai 1982. Soixante-dix-huit stations étaient distribuées sur une ligne proche de 48°N et allant de l'entrée de la Manche jusqu'aux Grands Bancs de Terre-Neuve. On a mesuré la pression, la température et la salinité à l'aide d'un système CTP numérique Guildline. Les données de salinité, d'oxygène dissous, de silicate, de nitrate et de phosphate ont été mesurées sur des échantillons prélevés lors des remontées du CTP. On présente aussi des figures montrant le plan des stations, la topographie du fond et des sections des profils de température, de salinité, de densité potentielle, d'oxygène et d'éléments nutritifs. Les données du CTP et des flacons individuels, ainsi que les parametrès dérivés, sont tabulées aux niveaux standard. Les données du CTP à intervalles de 2 décibars et les données bathymétriques numériques sont disponibles en versions informatisées dans des formats présentés en annexe au rapport.

INTRODUCTION

Between April 11 and May 2, 1982, Cruise 82-002 of C.S.S. Hudson occupied a line of hydrographic stations in the North Atlantic Ocean near 48°N running from the mouth of the English Channel to the Grand Banks of Newfoundland. Operational details are described in Hendry (1982). The goal of this work was to obtain a high quality set of measurements of temperature, salinity and associated chemical parameters along the section as part of an international effort to provide a modern large-scale description of the North Atlantic Ocean. This renewed concern for systematic descriptive oceanography was motivated by the need to quantify the ocean's role in the global climate system and to investigate possible long-term changes in ocean properties as a measure of interannual climate variability. The 48°N section was a near repeat of a North Atlantic section occupied by R.R.S. Discovery II during the International Geophysical Year of 1957-1958 (Fuglister, 1960).

This document discusses procedures followed in the collection and processing of the resulting CTP (conductivity-temperature-pressure) measurements and discrete measurements of salinity, dissolved oxygen and nutrients. Estimates of the accuracies of measurement for the various parameters are also discussed. Sectional figures of temperature, salinity, potential density, dissolved oxygen and nutrients are included. Subsampled CTP data and derived parameters at standard levels and the entire discrete bottle data set and similar derived parameters are tabulated.

Computer compatible versions of all the data described in the report are available. Technical details concerning the formats for these versions are described in the Appendices.

CTP DATA

Seventy-eight CTP stations were occupied along the 48°N line yielding measurements from just below the surface to within a few meters of the bottom in depths up to 4800 m. The measurement system used included a Guildline Mark IV digital CTP with dissolved oxygen sensor, a General Oceanics Rosette sampler and a bottom-sensing Datasonics acoustic pinger, all combined in a streamlined weighted body which permitted a nominal lowering rate of about 85 meters per minute.

Raw pressure, temperature, conductivity and oxygen data were logged at 25 samples per second. The raw data were subsequently reduced to 1-second averages of pressure, temperature and salinity in a calculation combining smoothing, conductivity lag correction and salinity computation, and then sorted into 2 dbar pressure bins. The CTP measurements of dissolved oxygen were of poor quality due to excessive noise and repeated failure of oxygen sensors, and no useful continuous oxygen results have been obtained.

Calibration of the CTP data was aided by comparison with discrete measurements of temperature and salinity obtained on the upcasts, as discussed below.

Pressure

Readings of upcast CTP pressure at Niskin bottle stops were compared with thermometric pressures calculated from paired protected and unprotected reversing thermometers with calibrations traceable to National Research Council of Canada standards or to equivalent standards in the thermometers' countries of origin. An empirical model CTP pressure correction varying linearly with pressure and instantaneous temperature was developed, using one set of coefficients for all 78 stations. The root mean square difference between corrected CTP pressure and thermometrically derived pressure was approximately 6 dbar. This comparison involved two independent readings of approximately 230 unprotected thermometers and double this number of associated protected thermometers over the full range of measured pressures. No independent checks on the pressure calibration of downcast readings are available, although some differences are expected due to the thermal time constants of the pressure case and the temperature sensitivity of the pressure transducer.

Bottom pressures

The bottom pressures given in the station headers of the tabulated data were derived by adding the maximum (corrected) pressure achieved by the CTP on a given cast to the pressure equivalent of the distance between the CTP and the bottom at this maximum pressure, as measured acoustically by the pinger attached to the CTP. These calculations generally agree to within 10 dbar (80% confidence) with the pressure equivalent of the bottom depth measured directly by the ship's echo sounder at the start of the CTP cast.

Temperature

The CTP temperature measurements were calibrated to the International Practical Temperature Scale of 1968 (IPTS-68) by a combination of post-cruise laboratory calibrations and comparisons with protected reversing thermometer readings at the discrete bottle stops on the upcast CTP profiles. A discussion of some of the details of the temperature calibration is found in Hendry (1985). The corrected CTP temperatures should be accurate to .002 deg.C in the range 1.5 to 6.5 deg.C, .007 deg.C at temperatures colder than 1.5 deg.C and .005 deg.C at temperatures warmer than 6.5 deg.C, all at 95% confidence. No significant differences in temperature calibration between downcasts and upcasts were detectable by matching readings by pressure, allowing for the temporal and spatial variability of temperature in the ocean.

Salinity

Salinity was derived from CTP pressure, temperature and conductivity using the formulas associated with the International Practical Salinity Scale of 1978 (IPSS-78). After final CTP pressure and temperature calibrations were defined, empirical conductivity calibrations were derived using a conductivity correction ratio (CCR) approach, comparing raw CTP conductivity with conductivity computed from discrete bottle salinity measurements and associated corrected CTP pressure and temperature readings. Significant station to station variability in conductivity calibration was noted, and the model included a constant term dependent only on station number. Significant pressure and temperature effects on CCR were apparent only at pressures less than about 2500 dbar and these effects were included in the model with a single set of coefficients for all stations. Significant differences in downcast and upcast CTP conductivity calibrations at a given station were indicated by comparisons at the same pressures on the downcasts and upcasts, and parameters for downcast calibrations were derived using upcast bottle salinities and downcast CTP conductivity measured at the same corrected CTP pressure as the bottle sample.

In the deep water (pressures greater than 3000 dbar) where temporal and spatial variability in salinity would be expected to be small on the scales of individual station durations (4 hours) and associated ship drift (10 km), the standard error of the difference between bottle salinity determinations and corrected downcast CTP salinity is of the order .002.

BOTTLE DATA

Discrete water samples were collected on the upcast of each CTP station using a maximum of 21 1.2 liter Niskin bottles attached to a General Oceanics Rosette sampler incorporated in the CTP package, and by Knudsen bottles lowered on a hydrowire for near surface samples on some stations. Protected and unprotected reversing thermometers were used on a subset of the Rosette sampler and Knudsen bottles for temperature and pressure calibrations. Approximately 1300 discrete water samples were collected over the course of the cruise.

Pressure

The pressure values associated with the Niskin bottle data are corrected CTP pressure readings at the time the bottle samples were obtained. The pressure values associated with the Knudsen bottle data are either thermometric pressure estimates from paired protected and unprotected reversing thermometers or estimates based on wire out in cases where no thermometric pressures were available.

Temperature

The temperature values associated with the Niskin bottle data are corrected instantaneous upcast CTP temperature readings at the time the bottle sample was obtained. The temperature values associated with the Knudsen bottle date are averages of two readings of one or two protected reversing thermometers and are considered accurate to .02 deg.C at 95% confidence.

Salinity

Salinity samples were collected in 170 ml glass bottles which were then tightly capped and allowed to come to room temperature before being analyzed on board ship using a Guildline Autosal salinometer. Salinity was computed from the salinometer conductivity ratio using the International Practical Salinity Scale of 1978 (IPSS-78) algorithm. The salinometer was standardized using IAPSO Standard Water obtained from the Standard Seawater Service, Institute of Oceanographic Sciences, Wormley, U.K. Standardizations were performed approximately every 12 samples. Three different batches of Standard Water were used : P80 (sample numbers 2534-2610); P85 (sample numbers 1301-1506, 1539-2117); and P86 (sample numbers 1507-1538, 2118-2533).

Duplicate salinity samples were drawn from approximately 10% of the water bottles for a check on repeatability of the sample handling and analysis. Of 129 paired samples, 121 (93.9%) showed differences in salinity with absolute values less than or equal to .002. Several of the Niskin bottles used to collect discrete water samples appeared to suffer intermittent problems of leaking, resulting in the contamination of a number of salinity samples, which were rejected in a manual editing procedure. Salinity samples which were rejected have been replaced in the discrete sample listings by corrected CTP salinities obtained on the upcast at the time the bottle samples were obtained. These cases are indicated in the listings by a "C" appended to the salinity reading.

Oxygen

Samples for oxygen were drawn and analyzed in accordance with standard Atlantic Oceanographic Laboratory practice, as detailed in Levy et al. (1977). The analysis involves manual shipboard titration using an improved version of the Carritt and Carpenter (1966) modification of the standard Winkler method. The sodium thiosulphate solution used in the titration was standardized against a potassium iodide standard solution from CSK Standard Solution Service, Sagami Chemical Research Center, Japan.

Duplicate oxygen samples were drawn and analyzed for approximately 10% of the bottle samples as a test of repeatability. Of 118 cases, 95 pairs (80.5%) showed differences in absolute value of oxygen concentration of less than or equal to .03 ml/l. Some oxygen values have been discarded in a manual editing stage which removed obvious outliers, with leaking Niskin bottles being a likely explanation for many of the outliers.

Nutrients

Samples were drawn for the three primary nutrient salts silicate [Si(OH)4], nitrate [NO2(-1) + NO3(-1)] and phosphate [predominantly HPO4(-2)] which were measured at sea using a Technicon Autoanalyzer II Industrial System.

1. The silicate method is basically Technicon Industrial Method No.186-72W (1973). The method involves the formation of a silicomolybdate blue complex, which is analyzed colorimetrically at a wavelength of 660 nm.

2. The phosphate method is basically Technicon Industrial Method No.155-71W (1973) which is a modification of the Murphy and Riley (1962) single solution method. The method depends on the formation of a phosphomolybdate blue complex, the colour of which is read at a wavelength of 880 nm.

3. The nitrate+nitrite method is basically Technicon Industrial Method No.158-71W which utilizes copper-cadmium reduction of nitrate to nitrite with ammonium chloride as a buffer.

Duplicate nutrient samples were drawn from approximately 10% of the water bottles as a test of repeatability. The results for absolute values of differences between duplicates are summarized as follows:

Silicate:	92 of 143 cases (64.3%)	$\leq$	.06	micromoles/l
Phosphate:	99 of 143 cases (69.2%)	$\leq$	.04	micromoles/l
Nitrate:	97 of 143 cases (67.8%)	$\leq$	.10	micromoles/l

Outliers in the nutrient data were discarded in a manual editing stage. Leaking Niskin bottles were the likely cause of many of the outliers. Shipboard contamination of some of the phosphate samples by detergent from the nearby ship's laundry area was also suspected.

NAVIGATION AND BATHYMETRY

Navigation aids used on the cruise included an Austron LORAN C receiver operating in range-range mode and a two-channel Marconi Transit satellite receiver. A navigation software system (BIONAV) integrated the ship's speed log and gyro-compass readings with these electronic aids. Continuous fixing was generally possible using LORAN C except for a period of approximately one day when the ship was out of range of all North Atlantic LORAN chains. Navigation data are expected to be accurate to within one nautical mile except for a few cases in the vicinity of the North Atlantic Ridge where LORAN was unavailable and navigation was by satellite fixes interpolated by dead reckoning. The station positions given in Table 2 below are as measured at the start of the CTP downcast.

Bottom soundings were carried out continuously while underway using the ship's Raytheon 12 kHz sounding system, with the results displayed on a graphic recorder. The sounding rolls were subsequently digitized and the soundings were corrected for sound speed variations using CTP-derived sound speed profiles interpolated along the cruise track. Tables of pressure as a function of depth derived from each CTP station were interpolated along the cruise track in a similar way to derive pressure equivalents for the corrected bottom depths.

Bottom soundings and navigation data were merged by time. The bottom profile in Figure 2 and in the sectional plots was produced from pressure equivalents of bottom depth tabulated at .01 degree longitude increments. The cruise track and sounding data expressed as uncorrected meters (sound speed 1463 m/s), corrected meters and decibars are available on a flexible diskette in a format described in Appendix 3.

SECTION PLOTS

A plot of bottom topography expressed as equivalent bottom pressure as a function of longitude is given in Figure 2. The locations of the standard-level CTP data are shown in this figure to provide an impression of the data coverage. Contoured section plots of the CTP and bottle data as a function of pressure and longitude are presented in Figures 2-9. The projection of the sections onto longitude as the horizontal coordinate results in some distortion of the horizontal scale, since the direction of the cruise track shifted from south of west in the eastern basin to due west in the western basin, but it provides a geographical reference frame. Pressure was selected for the vertical coordinate, with depth in meters being numerically nearly equal to pressure in decibars.

Prior to contouring, the standard-level CTP data and discrete bottle data were interpolated and extrapolated onto a regular grid in pressure and longitude with grid intervals of 50 dbar and 1/3 degree respectively. Computational points were defined only at levels shallower than the tabulated bathymetry at the location of the grid point. The interpolation was carried out using optimal linear interpolation. This method requires the specification of a covariance function and characteristic vertical and horizontal scales for variations in the fields to be mapped. Each grid point was assigned an equivalent fractional station number based on a linear interpolation of station number against along-track distance, and this equivalent station number was used as the horizontal coordinate in the optimal linear interpolation calculations to provide a spatially varying horizontal scale. No attempt was made to introduce any inhomogeneity in the vertical scale. A covariance function of the form

$$F(r) = (1 + r + r^2/3)\, e^{-r}$$

was used in the calculation. The scaled distance r between vertically and horizontally separated grid points was computed as

$$r^2 = [s1-s2]^2 + [(p1-p2)/200]^2$$

where (s1,p1) and (s2,p2) are the equivalent station number and pressure in decibars for each of the two points. A vertical separation of 200 dbar is equivalent to a horizontal separation of unit station spacing, which varies from approximately 18 to 78 km. The 15 data values nearest each grid point using this scaling were selected to control the interpolation at that grid point. This methodology produces reasonable results, but the covariance model was formulated on a somewhat arbitrary basis and no claims of statistical optimality are made. The calculation of each of the fields on 7850 grid points using approximately 1300 data points required about 100 minutes of central processor time on a Digital Equipment Corporation MicroVAX-II computer.

Computer-drawn contour plots of the gridded data were then produced.

ACKNOWLEDGEMENTS

Thanks are due to the officers and crew of C.S.S. Hudson for their efforts on Cruise 82-002. This 1982 repeat of the 48°N transect of R.R.S. Discovery II originated with a suggestion by Carl Wunsch. The idea was subsequently supported by George Needler and R. Allyn Clarke and this support is gratefully acknowledged. Also gratefully acknowledged are the data processing contributions of Jennifer Hackett, Cathy Porter, and Everett Caldwell.

LIST OF FIGURES

Figure 1. Station positions. The 200m (dashed line) and 4000m (solid line) bathymetric contours are shown.

Figure 2. Along-track bathymetry (pressure equivalent of bottom depth in decibars) plotted against longitude. The locations for the tabulated CTP data are indicated in the figure.

Figure 3. Section plot of in situ temperature (degrees Celsius) as a function of longitude (degrees) and pressure (decibars).

Figure 4. Section plot of salinity as for Figure 3.

Figure 5. Section plot of potential density anomaly (kilograms per cubic meter) as for Figure 3.

Figure 6. Section plot of dissolved oxygen (milliliters per liter) as for Figure 3.

Figure 7. Section plot of dissolved silicate (micromoles per liter) as for Figure 3.

Figure 8. Section plot of dissolved nitrate (micromoles per liter) as for Figure 3.

Figure 9. Section plot of dissolved phosphate (micromoles per liter) as for Figure 3.

TABULATED DATA

STATION HEADER

STN	sequential station number
LAT	north latitude in degrees, minutes and decimal minutes
LONG	west longitude in degrees, minutes and decimal minutes
	date of station occupation
	start time of station (UTC)
SOUNDING	bottom depth in meters at the point of closest approach of the CTP to the bottom. The pressure equivalent in dbar is also given.

CTP DATA (upper panel)

PR	gauge pressure in decibars (1 dbar = 10^4 Pa)
T	temperature in degrees Celsius [International Practical Temperature Scale of 1968 (IPTS-68)]
S	salinity [International Practical Salinity Scale of 1978 (IPSS-78)]
TH	potential temperature relative to zero gauge pressure
SIG-TH	potential density anomaly referred to zero gauge pressure in kg/m^3 relative to 1000 kg/m^3.
SIG-1.5	potential density anomaly referred to 1500 dbar gauge pressure
SIG-3	potential density anomaly referred to 3000 dbar gauge pressure
DEL-S	salinity anomaly at the observed potential temperature relative to a standard curve for the western North Atlantic computed by Armi and Bray (1982).

TABULATED DATA

CTP DATA (upper panel) (con'd)

DYN-HT — dynamic height relative to the sea surface in dynamic meters (1 dyn.m = 10 J/kg)

TRANS — geostrophic transport streamfunction relative to the sea surface in Sverdrups (1 Sv = 10^6 m^3/s)

DEPTH — depth in meters

Potential temperature and potential density anomaly were computed using the algorithms discussed in Unesco (1983). Dynamic height, geostrophic transport streamfunction and depth were computed by trapezoidal integration of the CTP data with respect to pressure using a pressure interval of 2 dbar.

BOTTLE DATA (lower panel)

PR — gauge pressure in decibars (1 dbar = 10^4 Pa). The pressure values associated with the Niskin bottle data are corrected CTP pressure readings at the time the bottle samples were obtained. The pressure values associated with the near-surface Knudsen bottle data (indicated by "K" appended to the sample number) are either thermometric pressure estimates from paired protected and unprotected reversing thermometers or estimates based on wire out in cases where no thermometric pressures were available.

T — temperature in degrees Celsius measured at the time the bottle sample was obtained. The temperature values associated with the Niskin bottle data are corrected CTP temperature readings. The temperature values associated with the Knudsen bottle data are from reversing thermometers.

S — salinity measured from the discrete bottle samples. Values rejected as outliers have been replaced by corrected CTP salinities measured at the time the bottle samples were obtained. These cases are indicated by a "C" appended to the salinity reading.

TABULATED DATA

BOTTLE DATA (lower panel) (con'd)

OXY	oxygen in milliliters per liter
SIL	silicate in micromoles per liter
PHOS	phosphate in milliliters per liter
NIT	nitrate in milliliters per liter
TH	potential temperature at zero gauge pressure in degrees Celsius computed from the tabulated bottle pressure, temperature and salinity
SIG-TH	potential density anomaly at zero gauge pressure in kg/m^3 relative to 1000 kg/m^3 computed from the tabulated bottle pressure, temperature and salinity
SN	sample number. The sample number combined with the year of collection (1982 in this case) uniquely identifies chemical data collected by the Atlantic Oceanographic Laboratory and the present day Physical and Chemical Sciences Branch, Scotia-Fundy Region. Sample numbers with an an appended "K" indicate Knudsen bottle samples.
DEPTH	depth in meters

The tabulated CTP and bottle data are also available on flexible diskette.

EXTERNAL FORMAT DESCRIPTION

This appendix describes the characteristics of a standard "external format" used by Physical and Chemical Sciences Branch, Scotia-Fundy Region for transferring data on magnetic tape. A printed summary is provided with the magnetic tape.

The printer output consists of a partial station header listing and the first data cycle. A verification program (listing included) reads back the data and summarizes the header, channel headers, comments and first few data cycles. This should be sufficient information to ensure the data are being read correctly.

Tape density and character type are recorded in the dayfile at the end of this job. Character type is either ASCII or EBCDIC. Tape density is 800, 1600, or 6250 bpi. All tapes are nine track.

External Format

Output records consist of 80 character logical records.

For tape output a stranger tape is written containing 5120-character physical blocks (64 records per block).

Each file contains a main station header (80 characters), one channel header (80 characters) for each data channel, comments (80 characters) if available, and data records.

The data records consist of a time stamp for each cycle of the form yydddhhmm, followed by up to 7 data channels / line. If there are more than 7 channels in the file, they follow on subsequent lines.

The number of channels, comments, data cycles, and lines required per data cycle are specified in the station header.

A data value which is missing is designated by a dummy value of -99.999.

EXTERNAL FORMAT DESCRIPTION (con'd)

Station Header

Format (I6, I5, 2F9.3, 2I5, I6, 2I5, I6, I5, I6, I2, 2I3)

Character No.	Field
1 - 6	cruise number
7 - 11	station number
12 - 20	latitude (degrees)
21 - 29	longitude (degrees)
30 - 34	magnetic variation (degrees)
35 - 39	bottom depth (meters)
40 - 45	start time (seconds)
46 - 50	start day (Julian)
51 - 55	start year
56 - 61	sampling interval (seconds)
62 - 66	section angle (degrees)
67 - 72	number of data cycles
73 - 74	number of records/cycle
75 - 77	number of channels
78 - 80	number of comments

Channel Header — The number of channel headers is specified in characters 75 -77 of the station header

Format (F3.0, 2X, A20, A10, A10, A6, A7, F5.0, F10.2, F7.0)

Character No.	Field
1 - 5	channel number
6 - 25	parameter name
26 - 35	parameter units
36 - 45	instrument type
46 - 51	instrument model
52 - 58	instrument serial number
59 - 63	sensor depth (meters)
64 - 73	time offset (seconds)
74 - 80	number of data values in channel

EXTERNAL FORMAT DESCRIPTION (con'd)

Comments — The number of comments is specified in characters 78 - 80 of the station header.

Format (A80)

Data Records — The number of data cycles is specified in characters 67 - 72 of the station header. the number of records per cycle is specified in characters 73 -74.

The number of data values / cycle is specified in characters 75 - 77.

Format (1X, I2, I3, 2I2, 7F10.3)

Character No.	Field
2 - 3	year
4 - 6	day of the year
7 - 8	hour
9 - 10	minute
11 - 20	first channel value this record
71 - 80	last channel value this record

EXTERNAL FORMAT DESCRIPTION (con'd)

```
c Sample Fortran Program

      program verify(input,output,tape2,tape10=output)
c program to verify the contents of a bio pcs external tape
      dimension datot(30)
      integer filcnt
      character comm*80, parnm*20, parun*10, insty*10, insmo*6, inser*7

BATHYMETRIC DATA

The cruise track and digitized bathymetry for Hudson 82-002 are available on IBM-compatible personal computer flexible diskette in the form:

TIME	- elapsed minutes since 00:00 UTC 1 January 1982
LAT	- north latitude
LONG	- west longitude
PRES	- pressure equivalent of bottom depth (dbar)
DEPTH1	- bottom depth (corrected m)
DEPTH2	- bottom depth (uncorrected m - sound speed 1463 m/s)
DIST	- along track distance (km)

e.g.

time	lat	long	pres	depth1	depth2	dist
146606.1	49.8439	9.74	133.9	132.9	130.9	.0
